## Abstracts

According to our (Global Info Research) latest study, the global Marine Desalination market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Marine Desalination, also known as desalination and desalination of seawater, refers to the process of removing excess salt and minerals from seawater to obtain fresh water.

Marine Desalination is mainly to provide drinking water and agricultural water, and sometimes edible salt is also produced as a by-product. Desalination is prevalent in the Middle East, where extreme precipitation is scarce. It is also used on certain islands and vessels. Some of the offshore thermal power plants and nuclear power plants also use desalination to produce water for cooling the core. Desalination requires a lot of energy, so the economic benefits are not high in countries that are not rich. The desalted by-product 'brine' (high salinity seawater) also has emission problems.

The Global Info Research report includes an overview of the development of the Marine Desalination industry chain, the market status of Municipal water (RO, MSF), Industrial (RO, MSF), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Marine Desalination.
