The global Marine Electric Propulsion System market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

An Electric Ship Propulsion System is a propulsion technology for watercraft that replaces traditional internal combustion engines with electric motors powered by batteries. This system eliminates the need for fuel consumption, reduces emissions, and provides a more sustainable and environmentally friendly solution for marine transportation. Electric ship propulsion systems are gaining popularity in various vessels, including boats and ships, offering advantages such as reduced noise, lower maintenance costs, and improved energy efficiency. These systems typically include components like electric motors, power electronics, batteries, and control systems, contributing to the growing trend of electrification in the maritime industry.

A marine electric propulsion system is a power system used in maritime vessels that relies on electric energy for propulsion. It typically includes electric motors, power converters, energy storage systems like batteries, and control systems. The system operates by converting electrical energy, often generated by diesel-electric generators or alternative sources such as fuel cells or shore power, into mechanical power to drive the ship's propellers. Marine electric propulsion systems offer advantages such as improved fuel efficiency, reduced emissions, and enhanced maneuverability. They are increasingly adopted in the maritime industry as part of efforts to achieve greater sustainability and comply with environmental regulations.
