Abstracts

The global Marine Fire Damper market size is expected to reach $ 143 million by 2032, rising at a market growth of 6.9% CAGR during the forecast period (2026-2032).

A fire damper can be defined as a device installed in ducts and air transfer opening of an air distribution or smoke control system designed to close automatically upon detection of heat. Marine Fire Damper is the fire damper that design and used in marine application. Combination Fire/Smoke Dampers are included because it is similar to the fire damper. Fire damper in the report is all mechanical fire dampers, the Intumescent Dampers and PFP/AFP Hybrid Fire Dampers are not included.

Market Drivers

1. Mandatory SOLAS and classification compliance

The strongest market driver is regulatory rather than discretionary. SOLAS requires ships to be divided into fire zones and establishes requirements for fire containment, smoke control, ventilation-system shutdown and the protection of escape routes. Classification societies and flag administrations verify compliance during newbuilding approval, periodic surveys and port State control inspections.

2. Growth of global shipbuilding and fleet renewal

Every new SOLAS-class vessel requires a fire-compartmentation and ventilation-isolation system. Demand is particularly strong for vessels with large accommodation blocks, multiple fire zones or complex ventilation networks, such as cruise ships, ferries, LNG carriers, container ships, naval vessels and offshore units.

UNCTAD continues to identify shipbuilding, fleet development and fleet renewal as core components of the global maritime transport industry. Maritime shipping carries more than 80% of global merchandise trade, sustaining a large installed base of vessels requiring fire-safety equipment throughout their service lives.
