Abstracts

The global Marine Fish Farming market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The marine fish farming industry plays an important role in the global fishery industry, and the future development prospect is very broad. Following are some factors that may affect the development of marine fish farming industry:

Market demand: With population growth and economic development, the demand for aquatic products is also increasing. Especially the demand for high-quality seafood, including the demand for protein-rich, low-fat seafood meat, and the demand for nutrient-rich fish oil and cod liver oil. This increase in demand is likely to boost the growth of the mariculture industry.

Aquatic resources: Many countries have abundant marine resources, including fish, shellfish, crustaceans, etc., which provide the basis for the mariculture industry. However, natural fishery resources are gradually dwindling due to overfishing and environmental concerns, making mariculture even more important.

Technological progress: With the advancement of science and technology, mariculture technology is also constantly improving. For example, the yield and quality of farmed fish can be increased through genetic improvement and improvements in feeding techniques. In addition, new aquaculture technologies and equipment, such as cage aquaculture, aquafeed production and processing technologies, have also provided support for the development of the mariculture industry.

Policy support: Many countries encourage the development of mariculture in order to

protect natural fishery resources. The government provides various supports, including the provision of breeding sites, loan support, tax incentives, etc., to promote the development of the mariculture industry.

Health and Environmental Consciousness: As people become health and environmentally conscious, the demand for healthy seafood is also increasing. Sea-farmed fish are generally safer and more hygienic than wild-caught fish because they can receive better care and treatment during the farming process. In addition, mariculture can help protect wild fish and marine ecosystems, as they reduce pressure on natural fishery resources.

However, marine fish farming also faces some challenges. For example, improvements in farming techniques and management are key to reducing problems such as disease and pollution. In addition, environmental impacts also need to be better controlled to protect marine ecosystems.

Overall, the future of marine fish farming looks promising. However, in order to achieve sustainable development, it is necessary to continue to improve technology and management, and to adopt corresponding policies and measures.

Marine fish farming is a production activity of using coastal shoals to raise marine aquatic economic animals and plants. At present, seawater fish that have been raised artificially include large yellow croaker, sea bass, flounder, grouper, yellowtail, puffer, etc.
