A marine hybrid system is a marine propulsion system that combines a traditional internal combustion engine with an electric motor. This system uses a combination of internal combustion and electric motors to propel the ship forward to improve fuel efficiency, reduce emissions and increase navigation flexibility. The main components of a marine hybrid system include an internal combustion engine, a generator, an electric motor, a battery pack, and related control systems. In this type of system, an internal combustion engine is typically used to generate electricity, which is converted into electrical energy by a generator for use by an electric motor. The electric motor directly or indirectly drives the ship's propeller or propeller.
