Abstracts

According to our (Global Info Research) latest study, the global Marine Magnesium Sacrificial Anode market size was valued at US\$ 30.33 million in 2025 and is forecast to a readjusted size of US\$ 44.22 million by 2032 with a CAGR of 5.6% during review period.

A Marine Magnesium Sacrificial Anode is a consumable cathodic-protection component made from magnesium alloy, which has a more negative electrochemical potential than the vessel metals it protects. Once electrically connected and immersed, the anode corrodes preferentially and supplies protective current to hulls, rudders, shafts, propellers, sea chests, freshwater systems, or other submerged metal parts. In 2025, Global Marine Magnesium Sacrificial Anode sales are estimated at 4,400 tons, with an average ex-works price of 6,700 US\$/Ton. The industry chain of Marine Magnesium Sacrificial Anodes starts from primary magnesium, magnesium alloy ingots, alloying elements such as aluminum, zinc and manganese, steel inserts, straps, bolts, coatings and packaging materials.

The growth of the Marine Magnesium Sacrificial Anode market is mainly driven by the steady maintenance demand from inland vessels, freshwater boats, lake yachts, freshwater marinas and small commercial craft, as well as vessel owners' preference for low-cost, replaceable and power-free cathodic protection. Environmental concerns over zinc discharge support some substitution toward aluminum and magnesium anodes, but magnesium's rapid consumption in high-salinity seawater keeps it positioned as a stable replacement market for freshwater and low-salinity vessels rather than a mainstream anode solution for large seagoing ships.
