Marine Mooring Bollard is a steel structure equipment commonly used in ports, docks and piers to fix ships and ensure that they are stable and safely docked when berthing. Mooring bollards are usually made of high-strength steel or cast iron, with a round or square design, usually with a ring or cylindrical protrusion on the top for ships to moor. Mooring bollards are designed to withstand strong tension to ensure that ships will not be displaced during mooring due to tidal changes, wind or other external factors. They are usually installed on docks, floating platforms or offshore structures and are an indispensable safety device in port facilities.
