A marine seismic source is a device used in underwater seismic surveys to generate controlled energy waves, which penetrate the seabed and reflect back to sensors. This data helps in mapping and analyzing subsurface geological structures, essential for oil and gas exploration, geological research, and environmental studies. Common types of marine seismic sources include air guns, water guns, and sparkers, which release bursts of compressed air, water, or electrical energy, respectively. These sources are deployed from vessels and synchronized to produce clear, high-resolution images of the seafloor and underlying strata. Their precise control and powerful output make them crucial tools for gathering accurate geological information in marine environments.
