According to our (Global Info Research) latest study, the global Marine Vortex Pumps market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The principle of Marine Vortex Pumps is to use a recessed impeller away from the path of the liquid to create vortices. The pump creates a circular stirring motion around a shaft to create suction. Fluid flows into the volute and out through the discharge port. Vortex impeller designs are non-clogging and have much less vibration as they do not generate pulsating pressure. They also have better wear resistance due to looser tolerances and eddy current induction as the driving force. Efficiency will remain similar throughout the life of the pump.
