Baloxavir Marboxil Tablets is a new, oral, single-dose anti-influenza virus drug belonging to cap-dependent endonuclease inhibitors. It exerts its effect by inhibiting influenza virus gene replication, which can rapidly eliminate the virus, shorten the course of disease, and reduce infectivity. Clinically, it is mainly used for the treatment of influenza A and B in people aged 12 years and older. It features rapid onset, convenient administration, and good tolerability, and is currently a first-line targeted anti-influenza drug in clinical practice. In 2025, global production of Baloxavir Marboxil Tablets reached approximately 120 million tablets

As a new-generation anti-influenza drug, Baloxavir Marboxil Tablets (Xofluza) has rapidly become an important player in the global anti-influenza market relying on its core advantages of single oral dose, rapid onset and high compliance. Its unique cap-dependent endonuclease inhibition mechanism can block virus proliferation at the early stage of replication and significantly shorten the course of disease and infectious period. In the Chinese market, the drug has achieved rapid growth since its approval in 2021, and its accessibility has been significantly improved through medical insurance access, occupying a mainstream position in the high-end anti-influenza segment. With the successive launch of domestic generic drugs and innovative drugs, market competition has intensified, and the market will present a tripartite pattern of imported original drugs, domestic generic drugs and domestic innovative drugs in the future. Meanwhile, drug resistance risk and medical insurance cost control will become key factors affecting its

long-term market development.
