According to our (Global Info Research) latest study, the global Mask Inspection Equipments market size was valued at US\$ 1984 million in 2025 and is forecast to a readjusted size of US\$ 3640 million by 2032 with a CAGR of 9.2% during review period.

A mask is an original master for transferring IC patterns to the semiconductor wafers. Defects during lithography that exceed expected size must be identified and corrected. Semiconductor devices are manufactured using photomasks, which serve as the source of original patterns for integrated circuits.

The mask is a graphic transfer tool or master plate in the microelectronics manufacturing process, which is usually composed of a substrate and a shading film, of which the most important raw material is the mask substrate, accounting for more than 90% of the direct material. Mask is mainly used in flat panel display, semiconductor and other downstream fields, currently still occupied by overseas head mask manufacturers occupy the main market.

Semiconductor mask: The localization process is expected to accelerate, and the demand space is further opened. Overseas manufacturers still occupy the main market share of tripartite mask, and most of them have advanced process mass production capacity, and domestic enterprises have greater space for development. Under the export restrictions of the United States, the process of semiconductor mask localization is expected to accelerate.
