The global Matrix-Assisted Laser Desorption Ionization Mass Spectrometer (MALDI-MS) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Matrix-assisted laser desorption/ionization mass spectrometer (MALDI-MS) is a type of mass spectrometer that uses a laser to ionize large, non-volatile, and thermally labile biomolecules such as proteins, peptides, and carbohydrates, without fragmentation. In MALDI-MS, the sample is mixed with a small amount of matrix material, typically a crystalline compound, and then deposited on a metal plate. The laser is then directed at the sample, and the energy from the laser vaporizes both the matrix and the sample, creating a cloud of ions that can be analyzed by the mass spectrometer to determine their mass-to-charge ratio. MALDI-MS is particularly useful for the analysis of large biomolecules and is widely used in fields such as proteomics, clinical diagnostics, and pharmaceutical development. It has several advantages over other mass spectrometry techniques, including its ability to handle large samples, its simplicity, and its high sensitivity and specificity. However, MALDI-MS is not without its limitations, and it may not be the best choice for every application. The choice of mass spectrometry technique will depend on the specific requirements and goals of the analysis.
