## Abstracts

According to our (Global Info Research) latest study, the global MCHP market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Micro combined heat and power or mCHP is an extension of the idea of cogeneration to the single/multi family home or small office building in the range of up to 50 kW. Local generation has the potential for a higher efficiency than traditional grid-level generators since it lacks the 8-10% energy losses from transporting electricity over long distances. It also lacks the 10–15% energy losses from heat transfer in district heating networks due to the difference between the thermal energy carrier (hot water) and the colder external environment. The most common systems use natural gas as their primary energy source and emit carbon dioxide.

A micro-CHP system usually contains a small fuel cell or a heat engine as a prime mover used to rotate a generator which provides electric power, while simultaneously utilizing the waste heat from the prime mover for an individual building's heating, ventilation, and air conditioning. A micro-CHP generator may primarily follow heat demand, delivering electricity as the by-product, or may follow electrical demand to generate electricity and use heat as the by-product.

The Global Info Research report includes an overview of the development of the MCHP industry chain, the market status of Commercial (Engine Based, Fuel-Cell Based), Residential (Engine Based, Fuel-Cell Based), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of MCHP.
