According to our (Global Info Research) latest study, the global MCVD Optical Fiber Preform market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The MCVD optical fiber preform is a key material used to prepare optical fibers. The main equipment of the MCVD (modified chemical vapor deposition) process is the MCVD lathe. The pre-deposited quartz reaction tube is installed on the MCVD lathe, the pre-designed process menu is loaded, and the cladding is completed successively. The deposition, core layer deposition, shrinkage, polishing and other processes, and finally complete the production of the preform.

The key to the MCVD optical fiber preform preparation is to control the atmosphere and deposition parameters during the deposition process to achieve the required optical fiber structure and performance. This technology can prepare optical fibers with complex refractive index profiles and is widely used in fields such as optical fiber communications.
