Abstracts

According to our (Global Info Research) latest study, the global Mealworm Drying Machine market size was valued at US\$ 482 million in 2025 and is forecast to a readjusted size of US\$ 670 million by 2032 with a CAGR of 4.9% during review period.

The mealworm dryer dries from the outside to the inside. During the preheating period, the surface of the mealworm can be dried at a low temperature first, and then the temperature is gradually increased. The gradual drying from the outside to the inside is almost carried out at the same time. The surface is dry first and then wet, which can form a barrier to lock the moisture and nutrients inside the mealworm and prevent them from being completely evaporated, achieving the effect of crispy surface and juicy inside.
