Abstracts

The global Measurement Unmanned Surface Vessel market size is expected to reach \$ 390 million by 2032, rising at a market growth of 13.5% CAGR during the forecast period (2026-2032).

In 2025, global production of measurement unmanned surface vessels reached 980 units, with an estimated average selling price of \$165,000 per unit. A measurement unmanned surface vessel is an unmanned surface platform designed for tasks such as hydrographic surveying, bathymetry, hydrology, water quality monitoring, current velocity and flow measurement, terrain and geomorphology mapping, and environmental monitoring. Typically, it comprises a USV hull, a propulsion system, a power system, an autonomous navigation controller, a remote control/communication system, GNSS/RTK modules, IMU/INS units, obstacle avoidance radar or vision systems, as well as various measurement payloads—including single-beam/multi-beam echo sounders, side-scan sonar, ADCPs, water quality sensors, and LiDAR. Its core function is neither transportation nor combat, but rather to replace or assist manned survey vessels in performing high-precision data acquisition across rivers, lakes, reservoirs, ports, coastal zones, shallow waters, and hazardous environments. The upstream supply chain encompasses hull materials, propulsion motors, batteries, navigation and positioning systems, inertial navigation systems, sonar, ADCPs, water quality sensors, and software systems; the downstream market consists of clients in sectors such as water conservancy, maritime affairs, port operations, surveying and mapping, environmental protection, scientific research, marine engineering, dredging, and offshore wind power. Gross profit margins typically range from approximately 25% to 45%.
