According to our (Global Info Research) latest study, the global Mechanical Agitation Flotation Machine market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Flotation machine is the abbreviation of floating concentrator, refers to the completion of flotation process equipment. In the flotation machine, the ore particles and the flotation agent are mixed and stirred to form a slurry, wherein some of the ore particles are selectively fixed on the bubbles, and then float up to the slurry surface, and the remaining ore particles are retained in the slurry to achieve froth flotation mineral separation.

For mechanical agitation flotation machine, the aeration and agitation of the slurry are completed by the impeller and mechanical agitation device of the flotation machine. It belongs to the external gas self-priming flotation machine, generally the upper gas suction type, that is, air inhaled near the mechanical stirring device in the lower part of the flotation tank. This kind of flotation machine can not only self-prime air, but also self-priming slurry. It is easy to realize self-flow when returning the ore middlings, less auxiliary equipment, neat equipment configuration, simple operation and maintenance, etc. But this type of machine has small inflation and high power consumption.
