Mechanical Waste Processing System is a system that uses mechanical processes to sort and process waste materials. It typically involves the use of machines such as shredders, crushers, and screeners to break down and sort different types of waste materials, such as plastics, metals, and organic waste.

The mechanical waste processing system can be used in a variety of settings, including industrial facilities, recycling centers, and waste management facilities. It is designed to improve the efficiency of waste processing and reduce the amount of waste that ends up in landfills.

In the mechanical waste processing system, waste materials are first fed into a shredder or crusher, which breaks down the materials into smaller pieces. The smaller pieces are then sorted using a series of screens and other mechanical processes to separate out different materials.
