Medical Barb Sutures are an advanced type of suturing material featuring uniformly distributed barbs along their surface, which allow for self-locking during suturing without the need for knots. This design improves surgical efficiency and reduces operating time. The barbs provide secure anchoring within tissues, effectively preventing suture slippage while minimizing tissue damage. Medical barb sutures are typically made from high-strength, absorbable, or non-absorbable materials and are widely used across various surgical fields, including plastic surgery, general surgery, obstetrics and gynecology, and cardiovascular procedures. Their unique design not only ensures superior wound closure but also helps reduce postoperative pain and complications for patients.
