Abstracts

The global Medical Bone Screw market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The driving factors for the development of medical bone screws mainly come from the following aspects:

Clinical needs: The demand for fracture treatment is increasing, and the requirements for treatment methods and medical devices are also increasing. In order to better meet clinical needs, medical bone screws are constantly optimized and improved in design and materials.

Technological progress: With the continuous development of science and technology, the emergence of new materials and processing technologies has provided better conditions and higher production efficiency for the manufacturing of medical bone screws. For example, screws made of biodegradable materials can be gradually decomposed and absorbed, avoiding the pain and complications of secondary surgical removal.

Medical regulations: The regulatory requirements of various governments for medical devices are constantly increasing, and the introduction and update of relevant regulations and standards have promoted the continuous improvement and perfection of medical bone screws in terms of materials, performance, safety, etc.

Clinical practice: Doctors' practical experience and feedback in fracture treatment provide valuable opinions and feedback on the design, function, and use effects of medical bone screws, and promote the continuous improvement and perfection of

medical bone screws.

Medical bone screws are an indispensable instrument in surgical fracture operations. They can be used to fix fractured bones and promote bone healing.

Bone screws are generally made of metal materials, such as stainless steel, titanium alloy, titanium-nickel memory alloy, etc. They can also be made of inorganic non-metallic materials, such as alumina ceramics. It can also be made of organic polymer materials, such as polymethylmethacrylate.

During fracture surgery, the doctor will select the appropriate screw type and material based on the patient's specific situation and surgical needs, and insert the screws into the fracture site for fixation, so that the fracture end can gradually heal. Medical bone screws are biocompatible, have no toxic effects when implanted in the body, and have no obvious adverse reactions to the growth of bone tissue. They are an ideal internal fixation for cancellous bone.
