A central venous catheter is a plastic tube that is inserted into a large central vein in the neck, chest, or groin. Most catheters are tunneled, and they are buried under the skin in the chest cavity into a vein in the neck. The part used for hemodialysis is exposed through the chest skin. The two lengths of tubing are joined by a Y-valve, each end of which is fitted with a cap. When the catheter is used for a short time, it can be secured with sutures. In most cases, the catheter has a cuff that wraps around the subcutaneous line. Your tissue will grow around the sleeve, holding it in place. Once the catheter is in, only a doctor can remove it.
