Abstracts

The global Medical Cold Plasma Equipment for Aesthetic market size is expected to reach \$ 280 million by 2032, rising at a market growth of 15.3% CAGR during the forecast period (2026-2032).

Global sales of medical cold plasma equipment for aesthetics reached 10,378 units in 2025, with an average price of US\$9,863 per unit.

Medical cold plasma equipment refers to non-thermal atmospheric plasma (CAP) medical aesthetic devices specifically designed for skin rejuvenation, anti-aging, and appearance improvement. Through the controlled release of reactive oxygen and nitrogen species (RONS), it achieves epidermal micro-exfoliation, dermal collagen remodeling, and microbial elimination, achieving skin rejuvenation, tightening, spot removal, and acne control without damaging the skin barrier. The operating temperature is typically controlled between 37–42°C to avoid thermal damage.

The raw materials for cold plasma devices used in cosmetic procedures include high-purity inert gases (helium or argon, for jet-type devices) or ambient air (for DBD-type devices), precision electrodes and dielectric components (tungsten needles/stainless steel electrodes, quartz glass tubes, alumina ceramics or flexible polyimide dielectric layers), high-voltage/RF power modules (kV-level pulse power or MHz-level RF power), and medical-grade structural components (biocompatible plastic shells, aluminum alloy heat dissipation frames). In addition, high-end devices need to be equipped with semiconductor cooling chips (TEC) and gas filtration systems, while disposable treatment head protective covers constitute the main consumables. In terms of cost structure, the beauty equipment market exhibits significant segmentation: professional medical-grade equipment, requiring compliance with medical device certifications (CE/FDA/NMPA) and emphasizing precise energy control and cooling systems, has

hardware costs where precision power supplies and specialized gas pipelines account for 40-50%. Home-use portable devices, on the other hand, achieve lower prices through mass production and simplified gas systems (air-based DBD replacing helium jets). However, jet-type home-use devices still incur ongoing helium consumable costs (approximately 10-30 RMB per treatment), while DBD devices only consume electricity, resulting in a clear long-term cost advantage.
