According to our (Global Info Research) latest study, the global Medical Cold Plasma Therapy Equipment market size was valued at US\$ 158 million in 2025 and is forecast to a readjusted size of US\$ 494 million by 2032 with a CAGR of 17.9% during review period.

Global sales of medical cold plasma therapy equipment reached 12,484 units in 2025, with an average price of US\$12,277 per unit.

Medical cold plasma therapy equipment is a device that generates low-temperature, non-thermal equilibrium plasma at room temperature and pressure by ionizing a gas (such as helium, argon, or air) using a high-voltage electric field. It contains a large number of electrons, ions, free radicals, reactive oxygen/nitrogen groups, and ultraviolet light, enabling it to act on the biological body using these physical and chemical factors without burning tissue.

The core raw materials for medical cold plasma therapy equipment include high-purity inert gases (helium or argon, 99.99% or higher, used in jet-type equipment), precision electrodes and dielectric materials (tungsten needles/stainless steel electrodes, quartz glass tubes, alumina ceramic dielectric layers), high-voltage/radio frequency power supply systems (kV-level pulse or MHz-level radio frequency power supplies and impedance matching devices), and medical-grade structural components (biocompatible plastic shells, Teflon gas tubing). For radiofrequency surgical equipment, disposable saline irrigation tubing and plasma tip electrode consumables are also required.

In terms of cost structure, the equipment exhibits characteristics of 'high R&D

amortization and small-to-medium batch production': Initial R&D investment in plasma physics and medical safety verification is substantial (accounting for 40-60% of initial costs); the core high-voltage power supply and precision gas control module (mostly imported) account for 30-40% of hardware costs; and medical-grade certification (CE/FDA/NMPA) and clinical trial fees further increase unit costs. During the operation phase, the continuous consumption of helium constitutes the main consumable expense (jet equipment consumes several liters per hour), resulting in a single treatment gas cost reaching tens of yuan.
