## Abstracts

The global Medical Compression Socks market size is expected to reach \$ 419 million by 2032, rising at a market growth of 6.0% CAGR during the forecast period (2026-2032).

In 2025, global Medical Compression Socks production reached approximately 17.26 M units, with an average global market price of around US\$ 15.7 per unit.

Medical compression socks are ergonomically designed medical devices made of elastic fibers that provide external support to the veins in the lower limbs through gradually decreasing pressure from the ankle to the leg (or thigh). Their core function is to promote venous blood return in the lower limbs, reduce venous pressure, prevent or alleviate venous blood pooling, and help improve symptoms caused by poor blood circulation in the lower limbs.

The medical compression socks market is accelerating its upgrade along the lines of product innovation and scenario expansion, with a core focus on optimizing both user experience and functional adaptation. On the product side, breakthroughs are being made through material innovation and design upgrades. The application of new functional fibers balances pressure stability and wearing comfort, while additional functions such as antibacterial and breathability have become standard features. Innovative structural designs, such as two-piece designs, effectively address the pain points of inconvenience in traditional products. At the same time, product forms are becoming more segmented, covering not only medical treatment scenarios but also extending to diverse scenarios such as sports recovery, daily health care, and long-distance travel, meeting the personalized needs of different groups and driving the market to expand from single medical use to universal health protection.
