Medical dental polymers are polymer-based materials used in the fabrication of denture abutments and orthodontic abutments. A denture abutment is the portion of the bracket that discharges an artificial tooth during the restoration of a defective missing tooth and allows for the uniform transmission of the forces exerted by the artificial tooth to the oral tissues. Orthodontic abutment means the portion of the bracket in orthodontic appliances and retainers that is in contact with the mucosal tissues of the oral cavity. Dental abutment polymer material can be used to make full denture, removable partial denture, orthodontic braces and retainers and other dental restorations of the abutment part, so as to realize the connection of the restorations of the various parts of the restorations into an integral whole, the discharge of artificial teeth, the restoration of defective alveolar bone, jawbone, maxillofacial soft tissues, to bear and transfer the jaw force to increase the role of restorations fixation and stabilization.
