## Abstracts

According to our (Global Info Research) latest study, the global Medical Device Software Validation market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Medical device software verification is an important process to ensure the safety, effectiveness and reliability of medical device software. Without running the software, the code is analyzed to check whether the structure, syntax, variable usage, etc. of the code are correct, and whether there are potential risks and problems. Static analysis tools can help find some common errors in the code, such as uninitialized variables, memory leaks, etc. Run the software, input various test data, observe the running status and output results of the software, and check whether the software functions normally and whether the performance meets the requirements. Dynamic analysis can include different levels of testing such as unit testing, integration testing, and system testing.
