Abstracts

The global Medical Experiment Monkey market size is expected to reach \$ 10010 million by 2029, rising at a market growth of 12.5% CAGR during the forecast period (2023-2029).

Neuroscience research: Monkeys' neural systems are similar to humans, making them widely used in studying brain function, cognitive processes, and neurological disorders. Scientists can implant electrodes, record neural activity, and conduct behavioral tests to gain in-depth understanding of how the monkey brain works. Disease research: Monkeys can be used to model human diseases such as Parkinson's disease, Alzheimer's disease, and more. Scientists can introduce specific genes or pathological proteins, studying the disease progression in monkey models and testing the effectiveness of new drugs for treating the diseases. Drug development and safety assessment: Monkeys are valuable for evaluating the efficacy and safety of new drugs during the drug development process. By administering candidate drugs to monkeys, scientists can observe their therapeutic effects on diseases and gain insights into drug metabolism and toxicity reactions within the body. Vaccine research: Monkeys are extensively used in vaccine research. When developing new vaccines, scientists expose monkeys to pathogens to observe their immune responses and assess the protective effects of the vaccines. This research helps determine vaccine dosages, vaccination schedules, and immune mechanisms. Non-human primates are important model animals in clinical experiments, and cynomolgus monkeys are the most used species among experimental monkeys, accounting for nearly 70%. Drug research and development has high requirements on the quality of experimental monkeys. Generally, they can only be used in animal experiments when they grow up to 2-3 years old, and they have strict quality standards. About 70,000 monkeys are used each year in the US for brain, infectious disease and aging research, about 5,000 in the EU and about 2,000

in the UK.

Human biology and disease can be studied in Monkeys because they are very similar to humans; biologically, anatomically, and physiologically. They have similar brains, muscle structure and reproductive and immune systems. This means research with monkeys give us results which are more relevant to humans compared perhaps with the information obtained from mice or rats.
