## Abstracts

The global Medical Fumed Silica market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Fumed silica, also known as pyrogenic silica, is white, synthetic, amorphous silicon dioxide (SiO<sub>2</sub>) in powder form, made by flame hydrolysis of silicon compounds. The application of fumed silica in medical treatment is mainly reflected in medical organosilicon materials and pharmaceuticals. From medical infusion tubes, drainage tubes, oxygen masks to various human catheters such as intravenous catheters, urinary catheters, blood vessels, etc., as well as various artificial organ tissue Fumed silica, also known as pyrogenic silica, is white, synthetic, amorphous silicon dioxide (SiO<sub>2</sub>) in powder form, made by flame hydrolysis of silicon compounds. The application of fumed silica in medical treatment is mainly reflected in medical organosilicon materials and pharmaceuticals. From medical infusion tubes, drainage tubes, oxygen masks to various human catheters such as intravenous catheters, urinary catheters, blood vessels, etc., as well as various artificial organ tissue substitutes, silicone materials will be used. The bio-chemical stability and special surface adsorption of fumed silica make it have great application potential in medicine. It can not only be used as a topical agent for the treatment of inflamed wounds, eczema, psoriasis, and allergic dermatitis, but also can be used as an internal adsorbent for the treatment of pancreas, intestinal infection, pleurisy, cellulitis, hepatitis, and chronic sclerosis. The treatment of lung disease and obstetrics and gynecology inflammation can also be used for the treatment of tumor patients, reducing the side effects of radiotherapy and chemotherapy, etc...
