The global Medical Hemodialysis Catheter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The working principle of the hemodialysis catheter is that after the catheter is inserted into the central venous system, it is connected to the hemodialysis circuit and the dialysis machine. The blood containing metabolic waste of the dialysis patient is sucked from the arterial end of the catheter, passes through the circulation circuit and the dialysis machine, and passes through diffusion and convection. And adsorption and other physical mechanisms, remove excess water and toxins in the body, adjust the patient's electrolyte and acid-base balance, and the purified blood is pumped back to the central vein of the human body at the venous end of the catheter.
