## Abstracts

The global Medical Heparin market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Heparin is an anticoagulant drug commonly used to prevent and treat thrombotic diseases. It is a natural polysaccharide substance secreted by liver cells and lung cells, which has the effect of inhibiting thrombin and preventing blood from clotting in blood vessels.

Heparin is usually administered by intravenous or subcutaneous injection. It is widely used in cardiac surgery, hemodialysis, treatment of thrombotic diseases, and other situations that require anticoagulation. Unlike other anticoagulants, the effect of heparin is reversible, which makes it very useful in situations where anticoagulation needs to be quickly stopped, such as during surgery.

However, the use of heparin also carries some risks, such as bleeding and other side effects. Therefore, before using heparin, doctors will assess the risks and benefits based on the patient's specific condition and develop a personalized treatment plan.

This report studies the global Medical Heparin production, demand, key manufacturers, and key regions.
