The global Medical Hollow Fiber Membrane Spinning Production Line market size is expected to reach \$ 413 million by 2032, rising at a market growth of 3.8% CAGR during the forecast period (2026-2032).

A Medical Hollow Fiber Membrane Spinning Production Line is a specialized manufacturing line used to continuously produce medical-grade hollow fiber membranes?tiny tubular porous fibers that serve as the core separation material in devices such as hemodialyzers, oxygenators, blood purification filters, and some other medical filtration components. These lines typically form the fibers by extruding a polymer solution through a spinneret while controlling bore fluid, coagulation, stretching, washing, drying, and winding, so the final membrane has the required inner diameter, wall thickness, pore structure, permeability, and biocompatibility for medical use.
