The global Medical Hollow Fibre Haemodialyzer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The hollow fibre dialyzer, also known as a hollow fibre dialyzer, is made up of a hollow fibrous semi-permeable membrane as its main part of action. When haemodialysis is carried out, the patient's blood and dialysis fluid are introduced into the dialyzer at the same time, with the two flowing in opposite directions on either side of the dialysis membrane. With the help of the solute gradient, osmotic gradient and water pressure gradient on either side of the membrane, toxins and excess water retained in the body are removed and the body is replenished with the required substances.
