## Abstracts

According to our (Global Info Research) latest study, the global Medical Human Platelet Antibody Screening Kits market size was valued at US\$ 295 million in 2025 and is forecast to a readjusted size of US\$ 383 million by 2032 with a CAGR of 4.0% during review period.

In 2025, global sales of Medical Human Platelet Antibody Screening Kits reached approximately 470 k units, with an average market price of about USD 610 per unit, an annual production capacity of roughly 550 k units, and an industry-average gross margin of approximately 36%.

Medical Human Platelet Antibody Screening Kits are in vitro diagnostic reagent kits designed for qualitative or quantitative detection of antibodies directed against platelet-related antigens (primarily human platelet antigens, HPA, and/or HLA class I) in human serum or plasma. Typical products use ELISA, MAIPA (monoclonal antibody-specific immobilization of platelet antigens), Luminex bead-based assays, or similar immunoassay technologies, employing standardized platelet antigen cell panels, coated antigens, or multiplex beads to screen patient samples for the presence and reactivity pattern of platelet antibodies. These kits are primarily used to evaluate platelet transfusion refractoriness, fetal/neonatal alloimmune thrombocytopenia (FNAIT/NAIT), and other suspected platelet immune disorders, providing laboratory support for donor–recipient matching, tailored platelet transfusion strategies, and pregnancy management.

Upstream, Medical Human Platelet Antibody Screening Kits rely on platelet antigen sources (platelet membrane preparations or recombinant HPA antigens), high-quality

monoclonal antibodies, coated microwell plates or beads, enzyme conjugates, buffers and blocking solutions, along with disposable plastics and cold-chain packaging for stable distribution. Midstream, specialized IVD manufacturers develop the assay formulations, perform antigen/antibody conjugation, batch validation, and regulatory registration to produce standardized HPA/HLA antibody screening kits or cell panels. Downstream, the main users are blood centers and transfusion services, tertiary-care hospital laboratories, and transplant or high-risk pregnancy centers; testing is selective and indication-driven rather than high-throughput routine, focused on refractory platelet transfusions, complex immune thrombocytopenias, and specific pregnancy cases. Individual centers may consume only dozens to a few hundred tests per year, but aggregated across regional/national reference laboratories this adds up to the estimated global annual usage of a few million tests described above.
