The medical in situ hybridization instrument is an instrument used to detect and analyze the presence and expression level of specific gene sequences in cells or tissue samples. The hybridization instrument can be used to understand the occurrence mechanism and diagnostic markers of related diseases.

Based on the in situ hybridization technology, the medical in situ hybridization instrument can visualize the existence and distribution of the target gene by matching the nucleic acid sequence labeled with a specific DNA or RNA probe with the target gene sequence in the sample to be tested. The medical in situ hybridization instrument usually consists of sample processing system, heating or cooling system, probe and detection system, microscope and imaging system, etc. When using a medical in situ hybridization instrument for experiments or clinical applications, operators should follow the operation manual of the equipment and relevant safety regulations to ensure that the experimental parameters are set correctly and take necessary protective measures to ensure the safety of personnel and the accuracy of results .
