Abstracts

According to our (Global Info Research) latest study, the global Medical Lubricating Coatings market size was valued at US\$ 199 million in 2025 and is forecast to a readjusted size of US\$ 286 million by 2032 with a CAGR of 5.4% during review period.

In 2025, global medical lubricating coatings production reached approximately 400 tons, with an average global market price of around US\$462 per kilogram. In 2025, the global's total production capacity of medical lubricating coatings reached 520 tons. The industry average gross profit margin of this product reached 28%. Medical lubricating coatings are functional polymeric thin film materials applied to the surfaces of catheters, guidewires, needles, stent delivery systems, and various interventional medical devices. They are typically composed of hydrophilic or hydrophobic polymers, and their core function is to significantly reduce the coefficient of friction during contact with human tissue or device insertion, thereby reducing tissue damage, improving device permeability and operational smoothness, and in some applications, also providing additional functions such as anticoagulation, antibacterial properties, or biocompatibility optimization.

The upstream of the medical lubricating coating industry chain mainly includes suppliers of basic chemical raw materials and functional polymer monomers, as well as solvents, crosslinking agents, and additives. The midstream consists of lubricating coating material manufacturers and formulation development companies, responsible for coating system design, performance control, and coating process development. The downstream comprises medical device manufacturers, broadly covering cardiovascular intervention, urology, neurointervention, endoscopy, and minimally invasive surgery, ultimately entering the clinical application stages of hospitals, clinics, and surgical

centers, and are subject to strict regulatory systems such as the FDA, CE, and NMPA.

With the continuous increase in the proportion of minimally invasive interventional surgeries and the growing demand for high-end disposable medical devices, medical lubricating coatings are developing towards higher biocompatibility, longer lubrication durability, and multifunctional composites. Future growth will primarily be driven by the high-frequency use of cardiovascular and neurointerventional devices, the rising demand for chronic disease treatment due to global aging, and the increasing prevalence of disposable medical devices. Meanwhile, environmentally friendly water-based coatings, PFAS-free alternatives, and smart responsive coatings will become key areas for technological upgrades, propelling the industry towards higher added value and higher technological barriers.
