Abstracts

The global Medical Micro Diaphragm Pump market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Diaphragm pumps (also known as membrane pumps) work by positive displacement. These pumps use a motor to drive a connecting rod to oscillate an elastic membrane up and down to move air, gas, or liquid through a pumping action. On the downward stroke, the diaphragm sucks in the medium via the inlet valve and on the upward stroke, it forces the medium out via the outlet valve. The diaphragm hermetically seals the compression chamber from the drive mechanism. The micro pump can be used in the flow transport subsystem of the micro chemical analysis system, the micro drug quantitative release system, the micro constant flow metering system, the flow injection analysis system, the glucose detection system based on micro dialysis technology, the automatic injection system of the micro drug solution for medical use, pulse microdialysis glucose sensor system, etc.
