Abstracts

Nanocoating is a thin nanofilm applied to the surface that provides material properties such as corrosion protection, water and ice protection, friction reduction, rust and corrosion protection, bacteriostatic, self-cleaning, heat resistance, radiation resistance, and heat. It fulfills various functions that often play an important role in product design. The surface should be comfortable, easy to clean, and free from dirt, water stains and fingerprints. Traditional coating materials often do not meet today's growing material requirements. However, in recent years progress has been made using methods derived from nanotechnology.
