Abstracts

Near infrared imaging uses light from 650 to 950 nm to detect any caused changes, accidents, or illnesses. It is an effective diagnostic tool for tissue imaging that is minimally invasive and non-ionizing. Blood or water, which are the main components of tissues, do not absorb NIR well thereby increasing the changes in illumination for internal structures. Since it offers faster resolution and is less harmless to patients, it is beneficial over other strategies.

According to our (Global Info Research) latest study, the global Medical Near Infrared Imaging market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
