Abstracts

According to our (Global Info Research) latest study, the global Medical Nuclide Products market size was valued at US\$ 11470 million in 2025 and is forecast to a readjusted size of US\$ 20850 million by 2032 with a CAGR of 9.0% during review period.

Medical nuclide products refer to medical preparations or devices containing radioactive isotopes, which achieve diagnostic or therapeutic functions through the radiation released by their decay. Such products must strictly comply with radioactive safety standards and are widely used in the field of nuclear medicine. For example, imaging agents used in diagnosis assist in disease detection through gamma-ray imaging, and iodine-131 and lutetium-177 used in treatment destroy diseased tissues through targeted radiation. Their production, quality control and clinical use are subject to the dual constraints of national nuclear safety regulations and the drug regulatory system to ensure patient safety and the effectiveness of diagnosis and treatment.

The global medical nuclide products market is being driven by the growing prevalence of chronic diseases such as cancer, cardiovascular disorders, and neurodegenerative conditions, which require precise diagnostic imaging and targeted radiopharmaceutical therapies. Technological advancements in nuclear imaging modalities like PET and SPECT, combined with the increasing adoption of theranostic approaches, have significantly expanded clinical applications for medical nuclides. In addition, favorable government initiatives to promote nuclear medicine infrastructure, and increasing investment in radioisotope production facilities, particularly in developing regions, are further accelerating market growth.

Despite its potential, the medical nuclide products market faces several challenges. The short half-life of many radioisotopes requires localized and timely production, which puts pressure on logistics and supply chain networks, especially in geographically dispersed regions. Regulatory complexities surrounding the handling, transport, and storage of radioactive materials also increase operational burden. Moreover, a global shortage of key isotopes like Mo-99, and limited access to cyclotrons and nuclear reactors in many countries, hampers consistent supply. High costs and the scarcity of trained nuclear medicine professionals further constrain market expansion in certain areas.
