## Abstracts

The global Medical Percutaneous Puncture Surgical Robot market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment.

The Percutaneous Puncture Robot is used for percutaneous puncture procedures, which are primarily procedures to collect tissue samples for diagnostic purposes, such as the detection of early stage lung cancer, breast cancer and prostate cancer. During the biopsy procedure, the tissue sample is removed from the suspected target anatomy for further pathological examination. While traditional biopsy methods rely on the radiologist's manual insertion of the needle, the robotic-assisted method provides greater rigidity and precision through a more stable robotic arm than the manual method. It allows for a more accurate loop of the needle with the tissue sample. Imaging techniques such as magnetic resonance imaging (MRI), ultrasound and CT are used to localise the target anatomy and use image feedback to guide the needle to the target anatomy. The percutaneous puncture surgery robot also has the ability to perform

several procedures such as nephrostomy lithotripsy for the removal of kidney stones. The needle is inserted through a tiny incision in the patient's back and the kidney stone is removed.
