Abstracts

The global Medical Plasmin market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Plasmin refers to a proteolytic enzyme that can specifically degrade fibrin gel and is an important component in the fibrinolytic system. The coagulation and fibrinolysis systems in the body are interdependent and closely linked. Once the body generates a coagulation reaction, it also activates the fibrinolytic system almost simultaneously, removing excess thrombus in the body and reducing the level of fibrinogen in the body through a negative feedback effect, thus avoiding excessive aggregation of fibrin.
