Abstracts

According to our (Global Info Research) latest study, the global Medical Sterile Protective Covers market size was valued at US\$ 374 million in 2025 and is forecast to a readjusted size of US\$ 481 million by 2032 with a CAGR of 3.7% during review period.

In 2024, global sales of Medical Sterile Protective Covers reached approximately 110 million units, with an average market price of about USD 3.2 per unit, an annual production capacity of roughly 190 million units, and an industry-average gross margin of approximately 30%.

Medical Sterile Protective Covers are single-use or short-term sterile barrier products designed for use in operating rooms and other sterile environments to protect medical equipment, instruments, or defined procedural areas. Typical forms include plastic sleeves, drapes, and bags used to cover C-arm X-ray systems, digital subtraction angiography (DSA) units, ultrasound probes, power tools, cables, and waste-collection containers. They are typically made from polyethylene (PE), polypropylene (PP) films, or nonwoven fabrics and undergo terminal sterilization (e.g., ethylene oxide or gamma irradiation) before being supplied in sterile packaging to maintain an intact sterile barrier until use. Their primary function is to create a physical separation between the sterile surgical field and non-sterile equipment surfaces, preventing blood, body fluids, and microorganisms from contaminating devices, while also minimizing back-contamination from equipment to the sterile field.

On the upstream side, Medical sterile protective covers rely primarily on polymer and substrate suppliers providing polyethylene and polypropylene resins, films, and

nonwoven materials, along with companies that perform film blowing, lamination, coating, heat-sealing, and the provision of packaging materials and outsourced ethylene-oxide or gamma sterilization services. Downstream, the products are procured through medical-supply distributors, group purchasing organizations (GPOs), hospitals, and independent surgical centers, and actual consumption is strongly correlated with the global volume of surgical procedures and imaging/ultrasound-guided interventions. In clinical practice, C-arm-guided surgeries, orthopedic, cardiovascular and neurosurgical procedures, interventional radiology, and point-of-care ultrasound examinations typically require dedicated sterile protective covers for each procedure; once a cover is opened and used, it cannot be reused, so demand is strictly per-procedure. This makes sterile protective covers a high-frequency, recurring consumable category within hospital purchasing.
