## Abstracts

According to our (Global Info Research) latest study, the global Medium Carbon Ferrochrome market size was valued at US\$ 118 million in 2025 and is forecast to a readjusted size of US\$ 144 million by 2032 with a CAGR of 2.9% during review period.

Medium-carbon ferrochrome typically has a carbon content between 1% and 4%, and a chromium content of approximately 55% to 65%. It is usually produced through silicothermic or aluminothermic reduction methods, combining the properties of high-carbon and low-carbon ferrochrome. It is suitable for manufacturing engineering structural steels, alloy tool steels, and some stainless steels where carbon content control is required, and performs particularly well in steel grades requiring moderate strength and toughness. The average price of this product is approximately US\$1935 per ton, with global sales of approximately 59,000 tons.

The ferrochrome market is closely dependent on upstream chromium ore resources and downstream stainless steel demand. Upstream, chromium ore is mainly concentrated in South Africa (accounting for approximately 70% of global reserves), Kazakhstan, and India, resulting in high resource concentration and price fluctuations significantly influenced by geopolitical and environmental policies. Downstream, global stainless steel production continues to grow, particularly driven by infrastructure and manufacturing expansion in China, India, and Southeast Asia, which has fueled stable growth in ferrochrome demand. Looking ahead, with the development of green smelting technologies, low-carbon ferrochrome processes, and recycling, the ferrochrome industry will evolve towards higher purity, lower energy consumption, and greater environmental friendliness. The supply chain will also place greater emphasis on resource sustainability and regional diversification. Medium-carbon ferrochrome is

gradually transforming from a 'transitional alloy' to a 'functional alloy.' In the future, it will play a more important role in low-carbon smelting, precision alloy manufacturing, and green metallurgical processes, especially in high-end manufacturing sectors such as new energy vehicles, wind power equipment, and rail transportation, where demand will steadily increase. Simultaneously, environmental regulations are driving companies to adopt low-energy, low-emission aluminothermic reduction and vacuum decarburization processes, making the purity and customization capabilities of medium-carbon ferrochrome a core competitive advantage.
