## Abstracts

According to our (Global Info Research) latest study, the global Medium Frequency Melting Furnace market size was valued at US\$ 1867 million in 2025 and is forecast to a readjusted size of US\$ 3047 million by 2032 with a CAGR of 7.2% during review period.

In 2025, global sales of Medium Frequency Melting Furnaces reached 11,200 units, with an average selling price of US\$162,000 per unit. A Medium Frequency Melting Furnace is an electrothermal metallurgical device that uses a medium-frequency power supply to generate an alternating magnetic field, creating eddy currents within the metal charge through electromagnetic induction to achieve rapid heating and melting. It is widely used in foundries, special alloy production, and non-ferrous metal processing. The equipment mainly consists of a medium-frequency power supply system, induction coils, furnace shell, hydraulic tilting mechanism, cooling system, and automatic control system. It features high melting efficiency, precise temperature control, low metal loss rate, and low environmental emissions. Upstream raw materials include copper conductors, silicon steel sheets, power electronic modules, and refractory lining materials; downstream supply mainly consists of cast iron and steel casting companies, non-ferrous metal smelters, and metal recycling companies, delivered through engineering integration and direct sales models. The industry's total capacity is approximately 14,000 units per year, with an average gross profit margin of approximately 26%. The future lies in upgrading energy-efficient IGBT power supplies and integrating them with intelligent smelting control systems, while simultaneously adapting to the trends of green metallurgy and electrification. With increasingly stringent environmental regulations and the accelerated phasing out of traditional coal-fired furnaces, market demand is steadily increasing, and companies with power electronics

R&D and system integration capabilities will have more business opportunities.
