Abstracts

The global Medium Long Focus Laser Projection Equipment market size is expected to reach \$ 480 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032).

Mid-to-long-throw laser projection equipment is a projection display system that uses a laser light source and projects at a medium to long distance. This equipment can provide stable, high-brightness images at relatively long projection distances in living rooms, conference rooms, and educational venues, meeting the needs of large-screen displays. It is projected that by 2025, global sales of mid-to-long-throw laser projection equipment will reach approximately 452,000 units, with an average unit price of approximately US\$680 and a total global production capacity of approximately 1.05 million units. The upstream industry mainly covers the design and manufacturing of laser light source chip modules, the manufacturing of optical lenses and projection engines, the development of processing chips and control systems, and the supply of mechanical structures and heat dissipation components. The downstream industry mainly includes television and audio-visual brand manufacturers, home theater system integrators, and providers of educational and commercial display solutions. Gross profit margins are typically between 22% and 32%. The product cost structure mainly includes the cost of the laser light source module, the cost of optical lenses and projection engine components, the cost of the main control processor and image processing chip, the cost of the mechanical structure and heat dissipation system, the cost of the intelligent operating system and interface integration, and the cost of quality testing and calibration. Products are categorized by parameters, including Full HD and 4K models based on resolution, and models based on brightness, such as 1200 ANSI lumens and 1800 lumens. Downstream user demand for ANSI lumen and higher brightness models is categorized by throw ratio into mid-throw and long-throw projectors, including high

brightness, high contrast, low image latency, smart connectivity and voice control, compatibility with multiple input interfaces, ease of installation and maintenance, quiet and energy-efficient design, and support for multi-scene projection optimization. Downstream customers include home theater enthusiasts, business conference room users, educational institutions, and audio-visual system integrators. Policy drivers encourage the adoption of energy-efficient displays and smart terminal devices, and promote laser light sources and green energy-saving solutions. Technological innovation drives this growth, including more efficient laser modules, more advanced image processing algorithms and AI scene optimization, and integration with smart home and remote collaboration systems. Evolving consumer demands reflect users' continued pursuit of higher image quality, larger screens, easier installation, and smarter experiences. These factors collectively drive the growth potential of the mid-to-long-throw laser projection equipment market.

Laser projection equipment, also known as laser projectors, uses laser beams to transmit images. The optical components of the laser projection equipment are mainly composed of red, green and blue light valve, beam combining X prism, projection lens and driving light valve. There are red, green and blue lasers in the laser projection equipment. After the laser beam is expanded by the corresponding optical elements and processing chips in the machine, it is transmitted to the X prism to integrate the three laser beams, and then the integrated laser is transmitted to the projection screen by the projection objective lens to complete the entire laser projection display process.
