A medium-wave infrared simulator is a device used to simulate a medium-wave infrared radiation environment. It is mainly used to test, calibrate and study the performance of medium-wave infrared imaging equipment or sensors. It simulates infrared radiation conditions similar to those in a real environment by emitting infrared light of a specific band, so that various infrared detectors, imagers and other equipment can be accurately evaluated and debugged under controlled conditions. Medium-wave infrared simulators are widely used in aerospace, military, scientific research and other fields, especially in the development and verification of infrared technology.

Medium-wave infrared simulators play a vital role in infrared technology testing and verification, especially in the fields of aerospace, military and scientific research. With the continuous development of infrared detection technology, the requirements for accuracy and reliability of equipment are getting higher and higher. Medium-wave infrared simulators provide a controllable and highly repeatable test platform by simulating infrared radiation in real environments, effectively reducing the cost and risk of field testing. It not only accelerates the research and development process of infrared equipment, but also improves the performance and stability of products. It is a key tool

to promote the innovation and application of infrared technology.
