Abstracts

Functional additives for imparting flame retardancy to flammable polymers made by mixing melamine with various halogen derivatives, metal oxides, organic phosphonic acids or alkali metals

According to our (Global Info Research) latest study, the global Melamine Based Flame Retardant market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Melamine and its condensation products and salts are widely used as flame retardants. They are mainly used in combination with P-containing flame retardants in most applications, but also with metal hydrates and halogenated flame retardants. The main mechanism of action : Cooling of the polymer matrix by endothermic decomposition of melamine; thermal decomposition to produce non-flammable gases such as water, carbon dioxide and ammonia; formation of a carbon layer. The choice of melamine-based flame retardants mainly depends on the processing temperature of the polymer matrix and its effect on hydrolysis sensitivity
