According to our (Global Info Research) latest study, the global Membrane for Filtration market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A filtration membrane is a thin film material used for separating and filtering liquids or gases. It is usually made of materials such as polymers, ceramics, metals, etc., with different pore sizes and filtration efficiency. The main function of filtration membranes is to separate impurities, particles, bacteria, and other substances from liquids or gases through screening or blocking, in order to achieve purification, concentration, analysis, and other purposes. According to different application requirements, filtration membranes can be divided into various types, including microporous membranes, ultrafiltration membranes, nanofiltration membranes, reverse osmosis membranes, etc. Microporous membranes have a larger pore size and are typically used to remove larger particles and microorganisms; The pore size of the ultrafiltration membrane is small and can be used to separate large and small molecules; Nanofiltration and reverse osmosis membranes have smaller pore sizes and can be used to remove ions and soluble substances. Filter membranes are widely used in medical, life sciences, food, chemical and other fields. For example, in the pharmaceutical process, filter membranes can be used to separate and purify substances such as proteins, cells, viruses, etc; In the laboratory, filtration membranes can be used to prepare samples, concentrate solutions, remove impurities, and so on.
