According to our (Global Info Research) latest study, the global Membrane Cleaning Chemicals market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

One of the key issues which affect the effective performance of membrane separation technology is membrane fouling, a procedure in which unwanted solute or elements such as scalants, colloidal impurities and microbes found in feed water, are deposited onto the membrane surface and membrane pores during the water treatment process which affects the water processing speed and causes downfall in the performance of the membrane separation process. Membrane fouling can produce severe flux weakening and change in the quality of the water. Severe membrane fouling ultimately leads to membrane replacement. To ensure uninterrupted, faster and cost-effective operation, membrane cleaning becomes necessary which is done with chemicals such as antiscalants and cleaners.
