## Abstracts

According to our (Global Info Research) latest study, the global Membrane Degasification System (MDG) market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Dissolved gases affect the quality of drinking water and can reduce the effectiveness of non-potable water purification techniques using Reverse Osmosis and Electrodeionization. Membrane Degassing is a preferred answer to the problem, requiring no consumption or disposal of dosing chemicals to remove gases from solution. The technique uses a device known as a Membrane Contactor, or Membrane Degassing Unit (MDU)/(MDG). It employs a gas-permeable membrane, normally in combination with either a vacuum, or a flow of gas such as nitrogen, to remove the unwanted gases in the supply stream. Benefits of degassing include improved water quality, better process efficiency and higher performance of downstream purification equipment.
